

Assessment – Week 1 – Data Analysis with Python

- I completed all the tasks from the suggested list. For creating the first python file, I tried to complete the steps of the python instruction video. Moreover, I checked the materials of the previous course “Informatics I” about GitHub, however, I did not find them quite as useful as the suggested video as well as the “installation_guide” file.
- As I already took the course “Informatics I”, I thought that I would not learn that much for this week’s homework. However, it was extremely helpful to freshen up on the basics.
- Still, during the course “Informatics I”, I had never really understood Git and GitHub (especially the difference between them). Even though I still am not a pro, I feel like I get closer to understanding it, so that I will actually use it in the future. I was unaware how helpful GitHub can be if used correctly.
- The same applied for VS Code. I have used it before, but I have never gotten a proper introduction which is why I tried my best to bypass it. Hopefully, in the future, I will be using it more frequently.
- For the next weeks, I want to improve my skills of using the Terminal, as it seems to be quite helpful. In order to do so, I will have to really memorize some of the commands. Additionally, even though AI can build our code, I would like to be able to read and understand it. I have experienced some of my friends writing their Bachelor’s Thesis and ending up not understanding their code. As I am currently also working on my Bachelor’s Thesis (an empirical analysis comparing OLS and Random Forest), I do not want this to happen to me. This is one of the reasons why I initially signed up for this seminar.
