

Assessment – Week 2 – Data Analysis with Python

Completed tasks:

- I tried to complete as many tasks as possible in the ~5 hours.
- Even though I do have some coding experience due to the course “Informatics 1”, I watched the 2hr video on Python fundamentals. I did skip some parts as they were rather repetition than new to me. While watching, I tried to take some notes and completed the short quizzes in the video.
- As most of the video’s content was repetitive for me, I tried concentrating on the next tasks in a bit more depth.
- The fundamentals exercise took some time, however, it helped me a lot to repeat basic concepts as well as learn new Python fundamentals. I enjoyed just trying out some code, even though some of my code was built in a complicated way in the beginning, so I had to go over them a couple of times.
- Then, I tried out the challenge “Word guesser”. At first, I tried building it from scratch. This was more complicated than expected. Therefore, I switched to the template. This was much easier and worked, in the end.

What to work on in the next weeks/what I struggle with

- In the following weeks, I would like to be able to code complicated-looking tasks in a simple way (like the word guesser). When I tried coding it without the template, my code got super long and confusing.
- Moreover, I still struggle with data imports and importing modules in Python. I will need to get a bit more into that.
- Finally, I need to memorise the difference in treatment between the different object types.
